C REACTIVE PROTEIN (CRP)

Test Description	Value(s)	Unit	Reference Range
CRP - C REACTIVE PROTEIN Serum, Nephelometry	18	MG/L	0 - 6

Interpretation

- 1.
2. Measurement of CRP is useful for the detection and evaluation of infection, tissue injury, inflammatory disorders and associated diseases .
3. High sensitivity CRP (hsCRP) measurements may be used as an independent risk marker for the identification of individual at risk for future cardiovascular disease.
4. Increase in CRP values are non-Specific and should not be interpreted without a complete history.

NOTE

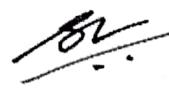

- 1) C-reactive protein (CRP) is a protein found in the blood, the levels of which rise in response to inflammation (an acute-phase protein).
- 2) Its physiological role is to bind to phosphocholine expressed on the surface of dead or dying cells (and some types of bacteria) in order to activate the complement system via c1q. CRP is synthesized by the liver in response to factors released by fat cells (adipocytes).
- 2)It is a member of the pentraxin family of proteins. It is not related to C-peptide or protein C. CRP is used mainly as a marker of inflammation. Apart from liver failure, there are few known factors that interfere with CRP production.
- 3)Measuring and charting CRP values can prove useful in determining disease progress or the effectiveness of treatments.
- 4)CRP is therefore a test of value in medicine, reflecting the presence and intensity of inflammation, although an elevation in C-reactive protein is not the telltale diagnostic sign of any one condition.

MRI BRAIN AND ANGIOGRAPHY

TECHNIQUE:

Sequences	Plane	Sequences	Planes
FSE T2WI	Axial, coronal, sagittal	FLAIR T2WI	Axial
FLAIR T1WI	Axial	DWI, ADC	Axial
SWI	Axial	FSPGR	Coronal
MRA	TOF	MIP 3D images	Coronal, Sagittal, axial
FSPGR	Axial source images		

FINDINGS:

Neuro parenchyma

Gross morphology of the supratentorial brain parenchyma is normal. The gyral /sulcal pattern appears normal. Cortex is normal in signal. Gray-white differentiation is well appreciated.

Basal ganglia, thalamus, subthalamic region are normal in morphology and signal.

Corpus callosum, internal capsule, hemispheric white matter, cerebral peduncles are normal.

Cerebellar hemispheres, vermis and peduncles shows normal morphology

Midbrain, pons and medulla are unremarkable.

CSF spaces

The lateral, third and the fourth ventricles are of normal size, shape and position. The basal, supra/para sellar and sylvian cisterns are normal. Extracerebral CSF spaces normal.

The pituitary gland, optic chiasm and optic tracts are normal.

General remarks

There is no evidence of any obvious focal/diffuse abnormality in the neuro parenchyma or other observed structures or any intra cranial space occupying lesion.

There is no mass effect, shift of midline structures or cerebral edema.

Skull

Skull, scalp, paranasal sinuses and mastoid cells are unremarkable.

**RADIOVISION
DIAGNOSTICS**

Accurate Diagnosis & Affordable Price

PT. NAME:	MS. PRATIKSHA CHAVAN	DATE:	28-11-2024
REF. BY:	DR. SWAPNIL BIRAJDAR	AGE/GENDER:	30 Y / F

MRA

The intra cranial ICA (including petrous, laceral and cavernous portions), MCA, ACA and PCA are well visualized. Both posterior communicating arteries are visualized. The basilar trunk and terminal parts of vertebral arteries are normal. The arteries show normal anatomy, MR morphology. No abnormally dilated segments or any vascular malformation seen. No abnormal displacement or aberrant course seen.

Both CCA and its bifurcation, internal and external carotid arteries are well visualised in the neck angiography images. Both carotids show normal dimensions, with normal wall thickness and smooth luminal margins.

Both vertebral arteries are visualised from the origin upto the formation of basilar trunk. No evidence of stenosis in the origin or along the course of the vessels.

IMPRESSION:

- ❖ MR imaging reveals no significant abnormality in the brain parenchyma or other observed structures.
- ❖ No evidence of any vascular lesion involving the neck or cerebral arteries. No occlusion or significant stenosis in the large arteries visualised in MRI.
- ❖ The circle of Willis and its branches show normal morphology.

1 Vitamin B12 ABOVE 1500 pg/ml 120 - 807
Serum, Method: CLIA

Interpretation

Low B12 level in a person with signs and symptoms indicates that the person has a deficiency but does not necessarily reflect the severity of the anaemia or associated neuropathy. Vitamin B12 levels are decreased in megaloblastic anaemia, partial/total gastrectomy, pernicious anaemia, peripheral neuropathy, chronic alcoholism, senile dementia, and treated epilepsy. Associated increased in homocysteine levels and Vitamin B12 has better predictivity for cardiovascular disease and deep vein thrombosis. Holo-Transcobalamin II levels and methylmalonic acid levels are more accurate markers of active Vitamin B12 component. Additional tests are usually done to investigate the underlying cause of the deficiency.

In method comparison study done at our centre, we found acceptable correlation and these results showed that there was no statistically significant between our methods and other Lab procedures (like, CLIA, CMIA, ELISA, IFA etc). The harmonization between total vitamin B12 assays is variable and individual results can differ significantly between assays. Though cut-off value of 200 pg/mL was used commonly, however, since there is not a reference method for measuring vitamin B12, this cut-off value may not be suitable to use in the evaluation of cobalamin deficiency diagnosis. Until the harmonization study between measurement methods is concluded, it is always suggested by NABL that laboratories should use their own reference values or reference values for Lab assay methods instead of cut-off value of 200 pg/mL.

* The analyte is not in the lab scope.

Referred By:	SANJEEVANI HOSPITAL	Client Name:	MEDIPLUS LABORATORY
Collection Date:	29-11-2024 19:04:00	Report Release Date:	30-11-2024 06:30:36

HbA1c (Whole Blood)

1 HbA1c-Glycated Haemoglobin	4.8	%	Non-diabetic: 4-6 Excellent Control: 6-7 Fair to good control: 7-8 Unsatisfactory control: 8-10 Poor Control: >10
EDTA Whole Blood, Method: HPLC			90-120 mg/dL : Good control 121-150 mg/dL : Fair control 151-180 mg/dL : Unsatisfactory control >180 mg/dL : Poor control
2 Estimated Average Glucose (eAG)	91.06	mg/dL	
EDTA Whole Blood, Method: Calculated			

Interpretation

1. The term HbA1c refers to Glycated Haemoglobin. Measuring HbA1c gives an overall picture of what the average blood sugar levels have been over a period of weeks/month. Higher the HbA1c, the greater the risk of developing diabetes-related complications.

2. HbA1c has been endorsed by clinical groups and ADA (American Diabetes Association) guidelines 2012, for the diagnosis of diabetes using a cut-off point of 6.5%. ADA defined biological reference range for HbA1c is between 4-6%. Patients with HbA1c value between 6.0-6.5% are considered at risk for developing diabetes in the future. Trends in HbA1c area a better indicator of glucose control than standalone test.

3. To estimate the eAG from the HbA1c value, the following equation is used: eAG(mg/dl) = 28.7 * A1c - 46.7.

4. Diabetic must aspire to keep values under 7% to avoid the various complications resulting from diabetes.

5. Certain conditions can give rise to a spuriously low HbA1C values. Such conditions include Hemolytic anemias, certain hemoglobinopathies (Hb SS, HbSC, Hb CC, unknown variant), recent blood transfusion, acute blood loss, hypertriglyceridemia, drugs (eg dapson, ribavirin, trimethoprim-sulfamethoxazole, hydroxyurea, vitamin C/E), chronic liver disease.

6. Certain conditions can give rise to a spuriously high HbA1C values. Such conditions include Iron deficiency, vitamin B12 deficiency, alcoholism, uremia, hyperbilirubinemia, drugs (chronic ingestion of salicylates in high doses and opiate addiction).

Note: The reportable range for HbA1C HPLC analyser is 3.8 % to 18.5 %, eAG calculation not possible above or below this range. In such scenario, observed HbA1c results may not be truly representative of the glycemic control and need to be cross checked by other methods of testing like fructosamine test.

End Of Report

* The analyte is not in the lab scope.

29/11/24

To whomsoever it may concern,

Mr. Pratik Chavhan 11 yrs old came to SMH with
40 degree fever towards RT side. Frequent
watery from RT eye, unable to swallow food &
water from 3 days. Fp done on 26/11/24.

Pt for fever hence pt get admitted to SMH
on 27/11/24. Pt is provisionally diagnosed with
Otitis pterygum. Pt needs to be under observation
until symptomatology gets relief & response to
treatment.

Dr. Abhijeet Shinde
